

Are your security measures **REALLY SECURE?**

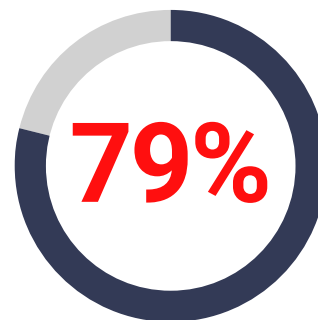

Despite pre-existing security access control measures,
security breaches remain an ongoing threat.

Tailgating is when someone deceptively follows another person into a secured area. **Piggybacking** is when an authorized person holds the door open for another.

In an independent study of security professionals by Signet:

say over the past two years,
they have had a security
breach, despite existing
security measures...

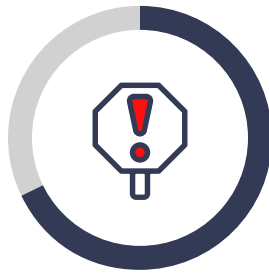

report that improvements to
their physical security could
have prevented those recent
security breaches.

Piggybacking and tailgating continue to pose security threats.

72%

say their facilities
face unauthorized
access issues.

68%

say monitored security
systems are not
stopping breaches.

75%

say their written
policies are
ineffective.

Security breaches can cost you millions.

The average cost of a
security breach, per
organization, is almost

\$3 million.

Some organizations
report their estimated
loss due to a breach at

**\$10 million
or more.**

Keep your most sensitive and valuable assets secure.
